Introduction to Cell-Biomaterial Engineering

Module 3, Lecture 1

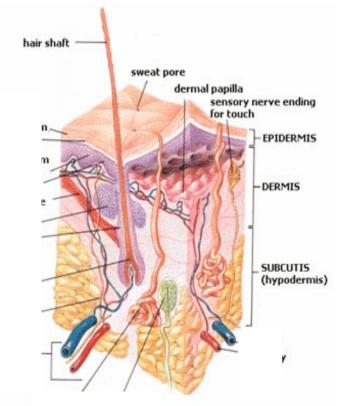

20.109 Spring 2010

Topics for Lecture 1

- Introduction to tissue engineering
 - motivation
 - basic principles + examples
- Introduction to Module 3
 - background: cells and materials
 - experiment: purpose and structure

Ability to repair tissue is limited

- Severe trauma (acute or diseasechallenges tissue repair capacity
- Donor tissue
 - scarcity, immune response (graft or
- Autologous tissue
 - availability, donor site morbidity
- Permanent synthetic substitute
 - inflammation, mis-match, failure
- A new approach: promote regen_ of ~native tissue

Tissue engineering: an emerging solution

"TE... applies the principles of engineering and the life sciences toward the development of biological substitutes that restore, maintain, or improve tissue function."

-R. Langer & J.P. Vacanti, Science 260:920 (1993)

What is in a tissue engineer's toolkit?

How good are the outcomes?

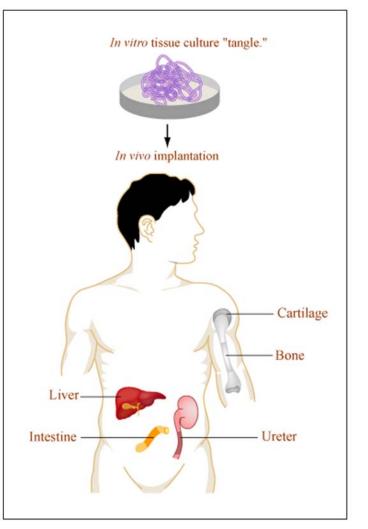

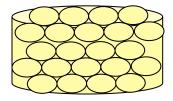

Image by MIT OpenCourseWare. After Langer and Vacanti (1993).

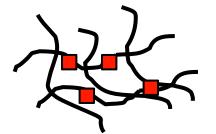

[Langer & Vacanti]

Scaffolds provide a framework

- Why a porous, degradable scaffold?
 - mechanical support
 - allow ingrowth, avoid inflammation
 - promote nutrient+oxygen diffusion

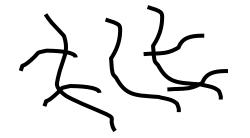

- How is the scaffold made degradable?
 - cross-links susceptible to cleavage
 - e.g., West JL & Hubbell JA, *Macromolecules* **32**:341 (1999)

collagenase exposure

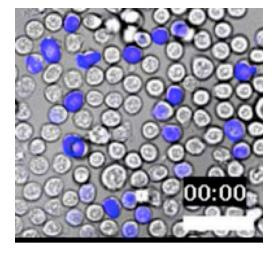

collagen peptide

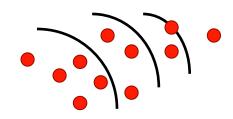

Cytokines promote cell functions

- Types of cytokines
 - growth factors (FGF, TGF, BMP)
 - angiogenic (VEGF)
 - chemokines (attract cells)
- Delivery of cytokines
 - release from scaffold or transplanted cells
- Example: CCL21 promotes T cell migration
 Stachowiak et al., *J Immunol* **177**:2340 (2006).

Control

Cells make up tissues

- · Progenitors vs. differentiated cells
 - scarcity, function
- Transplanted vs. in situ cells
 - scarcity, safety

- Example: tumor-infiltrating lymphocytes (TIL)
 - T cells lose function in tumors
 - expand TIL ex vivo, treat with cytokines, and transplant
 - tested in mice

Review: Rosenberg, et al. Nature Med 10:909 (2004).

Days After Treatment

Data from: Overwijk, et al. J Exp Med 198:569 (2003).

Source: Overwijk, W. W., et al. "Tumor Regression and Autoimmunity after Reversal of a Functionally Tolerant State of Self-reactive CD8+ T Cells." *J Exp Med* 198, no. 4 (August 18, 2003): 569. doi: 10.1084/jem.20030590 Courtesy of Willem Overwijk, et al., and Rockefeller University Press.

Components of a TE construct

scaffold/matrix

 \rightarrow usually degradable, porous

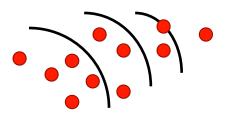

soluble factors

- \rightarrow made by cells or synthetic
- \rightarrow various release profiles

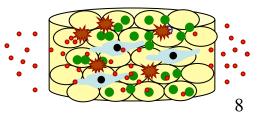

cells

- → precursors and/or differentiated
- \rightarrow often autologous

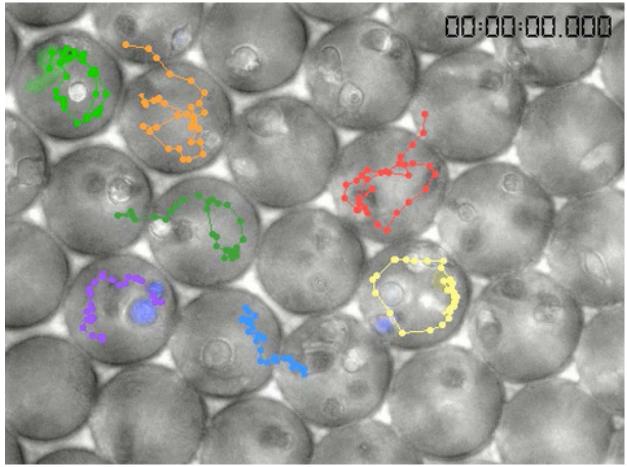

integrated implantable or injectable device

Putting it all together: in vitro construct

See supporting video, "Cells in Scaffold."

Commercial success in TE

- Regenerating severely burned skin
 - bilayer polymer [Yannas IV, et al. Science 215:174 (1982)]
 - top: protects wound, retains fluid
 - bottom: provides scaffold for growth
 - forms neotissue comparable to native skin
 - sold as Integra Dermal Regeneration template

Joint diseases: an unmet need

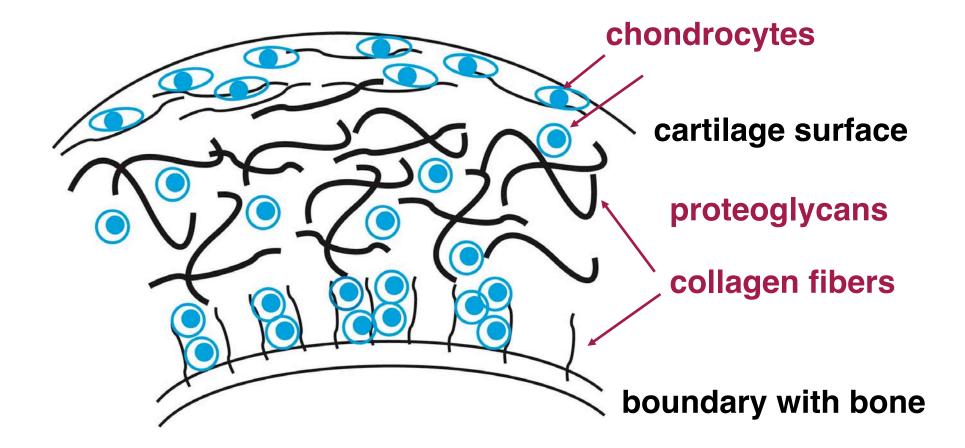

- Leading cause of physical disability in U.S.
- \$100's billion in in/direct costs
- Osteoarthritis
 - common in elderly population
 - acute injury (athletes) →
 susceptibility to early disease
- <u>http://www.youtube.com/watch?</u>
 v=0dUSmaev5b0&feature=related
- Limited pharma solutions
 - pain management
 - targets unknown
 - cell therapies (Genzyme, Osiris)

Our focus: cartilage tissue

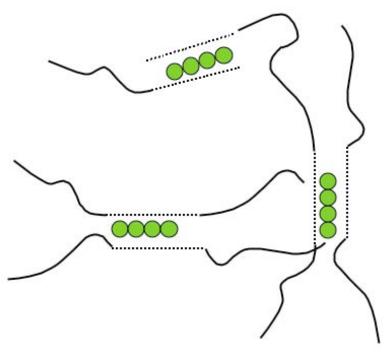

Water-swollen, heterogeneous, avascular tissue.

Alginate: material for 3D culture

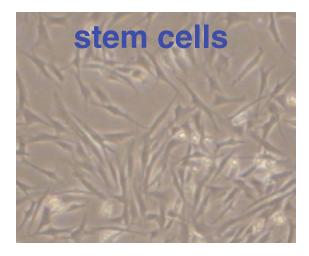

- Seaweed-derived polysacharride
- Co-polymer of M and G acids
- G-block polymer chains crosslinked by cations (e.g., Ca²⁺⁾
- Forms water-swollen gel
- G/M content and MW influence
 - mechanical properties
 - swelling
 - degradability
 - viscosity of solution

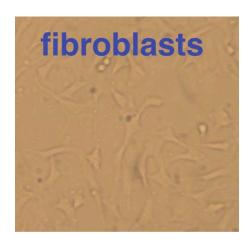

Cells for cartilage TE

	Stem cells	Chondrocytes
Obtained from	Bone marrow	Digested cartilage
Recovery	Difficult, initially very few cells	Easy, many cells
Expansion	Many-fold	Minimal
Upkeep	FGF to expand, TGF- β1 to differentiate	Multiple factors to maintain phenotype

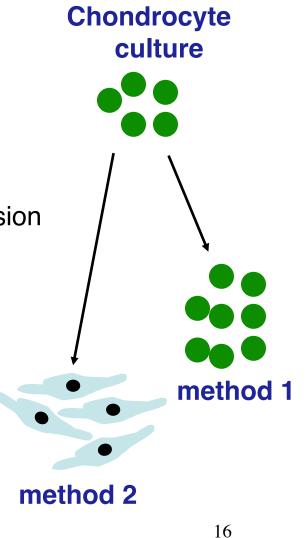

Specific goal and experiments

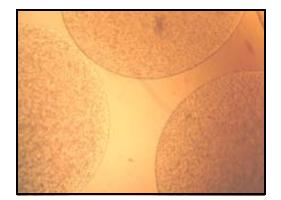

- **Goal:** examine effect of specific culture conditions on chondrocyte phenotype
- Observe cell morphology and viability
- Measure collagen content
 - Gene (RT-PCR) and protein (ELISA) expression
 - Collagen II:I ratio reflects cell state
- Grander purpose: cartilage TE
 - conditions for ex vivo cell expansion
 - conditions for *in vitro* cartilage production

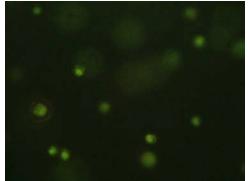

Module overview: lab

Day 1: design

Day 2: seed cultures

Day 3: viability assay

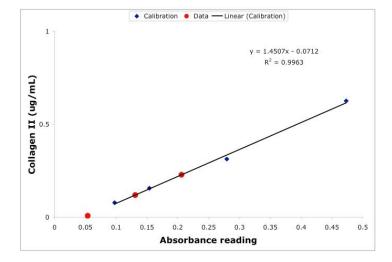

Day 4: prep RNA+cDNA

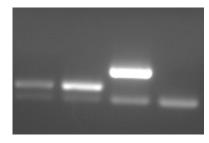

Day 5: transcript assay

Day 6: protein assay

Day 7: remaining analysis

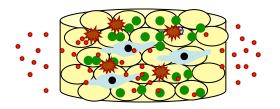

Day 8: your research ideas!

Lecture 1: conclusions

- Tissue engineering is an emerging interdisciplinary field
- Maintaining cell function is a key part of TE
- Alginate beads provide a culture system for researching soft tissues such as cartilage

Next time... more about engineered and natural biomaterials.
