View from the middle

## Flatten the brain

## (like making a map out of a globe, Only worse)

Image removed for copyright reasons.

Do we really have center-surround receptive fields?

The Hermann Grid

Do we really have center-surround receptive fields?

The Hermann Grid

Do we really have center-surround receptive fields?

Umm...what is
happening here?

The stimulus

Light

# Color 

How do you see color?

Wavelength 1 produces a response of size $\mathbb{X}$

Wavelength 2 produces a response of sive $X$

## The problem of "univariance"

Two wavelengths, one response.

## So, we have a problem.

## Here is a solution....add another cone type.

Two cones can give you color vision

$$
\mathbf{X} / \mathbf{Y}=\text { rect, } \mathbf{X} / \mathbf{Z}=\text { green }
$$ COMPARISONS ARE CRITICAL

## Three cones give you Irichromacy

## Three cones give you Irichromacy

Any light $=\mathrm{aL}+\mathrm{bM}+\mathrm{cS}$

## Let's add some patches together

Wavelength (nm)

## Let's take GREEN

Wavelength (nm)

## And add RED

## Wavelength (nm)

Red + Green $=(\mathbf{M} 1+\mathrm{M} 2) /(\mathrm{L} 1+\mathrm{L} 2)=1$

## Compare that to YELLOW

Wavelength (nm)

## Yellow = M3/L3 = 1

## It follows that

## RED

## It follows that

plus

## RED

GREEN

## Yields Yellow <br> $\mathrm{R}+\mathrm{G}$ and Y are <br> METAMIERS

This is ADDITIVE color mixture

## But what about color paint in kindergarten?

## Blue paint

Yellow paint

## Mixing paint is SUBTRACTIVE

The intersection of Blue paint and Yellow paint looks Green

Recall...Three cones give you Trichromacy

Suppose: if $\mathrm{S}=\mathrm{M}=\mathrm{L}$, then WHITE

## Suppose that L gets tired?

What does $\mathrm{S}=\mathrm{M}>\mathrm{L}$ look like?

## Pretty boring.......

## Pretty .......

## Pretty, not boring......

## Try this

Vertical and Horizontal look the same?

## -

 <br> \section*{\footnotetext{

## (a) <br> \section*{\footnotetext{ \section*{(a) <br> <br> <br> (ars) <br> <br> <br> (ars) <br> <br> <br> (a) <br> <br> <br> (a) <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br> (a) <br> <br> <br> (a) <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br>  <br> <br> <br> (a) <br> <br> <br> (a) <br> <br> <br>  <br> <br> <br>  <br> <br> <br> (2) <br> <br> <br> (2) <br> <br> <br> <br> <br> (2) <br> <br> <br> <br> <br> (2) <br> <br> <br> <br> <br> (2) <br> <br> <br> <br> (as) <br> <br> <br> <br> (as) <br> $\square$ <br>  <br>  <br> <br> <br> (arser <br> <br> <br> (arser <br> <br> <br> (arser <br> <br> $=$} <br> <br> $=$

Vertical and Horizontal look the same?

## So, you found all these nice

 features...what is the problem?Which lines group together?

How about here? Why?

## Which gray line is a likely continuation of the black

 line?

Which gray line is a likely continuation of the black line?

WHAT IS THIS?

## Does this seem likely?

## This seems more likely

## "Good continuation"

## One curved line or three?

You 'know' about occlusion

## One curved line or three?

You 'know' about occlusion

## Organized by columns or rows?

Now? Organized by columns or rows? Why?

Proximity

Now? Organized by columns or rows? Why?

Did Similarity trump Proximity?

## Let's magnify the critical bit.

## See that rectangle?

## How about that rectangle?

How about that circle?

Not as good?

Edges are important

The visual system distinguishes "real" edges from shadows

Image removed for copyright reasons.

Remember: You want to know about the world, not your retina

## COMy

## Minimal shadow can give you faces

Images removed for copyright reasons.
Faces from University of Bielefeld Cognitive Robot project.

## Depth Cues

Image removed for copyright reasons.

## From 2D-3D

## Occlusion

## Is this likely?

Size

## Texture

## Relative position (height in field)

## Here is why it works

## You don't need to recognize the objects

## Areal Perspective (haze)

The misty mountains far away

## Linear Perspective

## Vanishing point

## Linear Perspective?

Image removed for copyright reasons.

## Where is the vanishing point?

## Linear Perspective?

These local bits don't add up

## Linear Perspective?

These add up...ambiguously

## 5ffocloyys

Image removed for copyright reasons.

## But where is the sun?

## And let's not forget

Stereopsis,
Vergence,
and Motion parallax
