EXAM #3

Introduction to Psychology/ 9.00 Spring Semester 2009

Part I. Answer the multiple-choice questions below by selecting **one best** answer and marking the provided answer sheet. It is to your advantage to answer each multiple-choice question, as no penalties are given for incorrect answers.

If you believe that a question or answer is ambiguous (e.g., that there are more equally good answers then you are asked to mark), **mark the best answer** and include a note explaining why you believe the question is ambiguous - your note will be considered in the grading.

Part II. Choose **FIVE** (5) of the Short answer questions. Provide concise, informative responses directly in the space provided on the answer sheet.

Statement of Academic Integrity:

I confirm that the answers I give on this exam represent my own and that I will not engage in:

- A. Copying from another's person's examination paper or allowing another person to copy from my paper
- B. Unpermitted collaboration during the exam
- C. Revising and resubmitting a question for regrading without the instructor's knowledge and consent

Sign this page affirming that you agree with the above statement:

Lecture and Sacks Questions

- 1) What Piagetian developmental gain in thinking has been associated specifically with increased blood flow to the frontal lobes?
 - A. egocentric perspective
 - B. conservation of mass
 - C. theory of mind
 - D. object permanence
- 2) In one study (from Woodward, 1998), 3-month olds and 6-month olds repeatedly saw a person reach for an object (ball) on the left and not reach for a teddy bear on the right. Then, they saw a display in which the teddy bear was on the left, and the ball on the right. The person either reached for the teddy bear on the left (same action, new object) or the ball on the right (same object, new action). Looking time was used as a measure to infer how the 3-month olds and 6-month olds interpreted the relation between the initial habituation phase and the subsequent changed test phases. The results indicated
 - A. both 3-month olds and 6-month olds looked longer when the person grabbed a new object than when the person made a new action
 - B. both 3-month olds and 6-month olds looked longer when the person made a new action than when the person grabbed a new object
 - C. 3-month olds looked longer when the person made a new action, but 6-month olds looked longer when the person grabbed a new object
 - D. 6-month olds looked longer when the person made a new action, but 3-month olds looked longer when the person grabbed a new object
- 3) Adult development can be studied cross-sectionally or longitudinally. All of the following are true for cross-sectional designs relative to longitudinal designs EXCEPT for which answer?
 - A. Cross-sectional designs take less time to accomplish
 - B. Cross-sectional designs are less likely to be confounded by practice effects
 - C. Cross-sectional designs are less likely to be confounded by cohort effects
 - D. Cross-sectional designs are less likely to be confounded by selective attrition

- 9) The attribution of behavior to situations
 - A. is greater in collectivist than individualistic cultures, and is deliberative rather than spontaneous
 - B. is greater in individualistic than collectivist cultures, and is deliberative rather than spontaneous
 - C. is greater in individualistic than collectivist cultures, and is spontaneous rather than deliberative
 - D. is greater in collectivist than individualistic cultures, and is spontaneous rather than deliberative
- 10) What factor has been shown in experiments to *increase* the willingness for a bystander to help somebody?
 - A. the personality factor of extraversion
 - B. the presence of other, unknown experimental subjects
 - C. recent consideration of the importance of helping others
 - D. being alone
- 11) In Milgram's studies of obedience (shocks and learning), which factors did NOT influence the likelihood that subjects would administer shocks to the highest possible level?
 - A. the sex of the subject
 - B. if experiment was at university or office building
 - C. if the researcher gave no commands once the experiment started
 - D. if there was an ordinary person (not a scientist) in charge
- 12) In Festinger's original experiment examining cognitive dissonance, people took a boring test, and were then paid either \$1 or \$20 to lie and tell the next person that task had been interesting. When later asked to evaluate how truly interesting the task had been, who rated the task as most enjoyable?
 - A. the people who lied and were paid \$20
 - B. the people who lied and were paid \$1
 - C. the people who did not lie
 - D. the people who were paid either \$1 or \$20 equally

D. 80%	
A. delusions B. bizarre behaviors	ositive) sign/symptom of schizophrenia?
C. flat affect D. hallucinations	
schizophrenia, so will the othe A. 1% B. 10%	ntical (monozygotic) twin is diagnosed with er twin is
C. 50% D. 90%	
16) For ADHD, which is NOT true	
A. well managed drug car alone	e yields better results than behavioral treatment
	I to control response inhibition relative to children
	control of response inhibition in ADHD children, but trol of response inhibition in children without ADHD
	ar affects on frontal lobe activation in children with

A. people with autism scan faces differently than people without autism

B. people with autism scan faces differently than people without autism when

C. people with autism exhibit reduced activation in area MT in response to

D. people with autism exhibit reduced activation in the superior temporal

sulcus (STS) in response to seeing biological motion

17) Which is NOT true for studies of autism?

seeing motion

explicitly identifying emotions on faces

Name:	TA:	

- 18) Imaging studies of the reward system in the human brain have NOT found which result?
 - A. activation in the nucleus accumbens in anticipation of reward
 - B. increased activation in ADHD in the nucleus accumbens in anticipation of reward
 - C. activation in the nucleus accumbens in men for pain inflicted on an unfair person
 - D. an absence of activation for anticipation of loss
- 19) In the Oliver Sacks chapter, the patient with Tourette's syndrome was treated with Haldol and all EXCEPT which of the below occurred?
 - A. there was an immediate positive response
 - B. he chose eventually to take the medication during the week and not during the weekend
 - C. his job situation and home life improved
 - D. he became worse at ping-pong
- 20) In the Oliver Sacks chapter, all EXCEPT which of the below was true about the woman with "Cupid's disease"?
 - A. she had syphilis from her days of prostitution
 - B. she became flirtatious at the age of 88
 - C. penicillin killed the spirochetes evident in her spinal fluid
 - D. penicillin ended her disinhibition

Book Questions

- 21) Which of the following is NOT true about *teratogens*?
 - A. Smoking, alcohol, and drugs are examples of teratogens
 - B. Different organs are vulnerable to teratogens at different times.
 - C. Mother's stress level is considered as a teratogen to the zygote and embryo, but not to the fetus.
 - D. Environmental pollutants and ionizing radiation can cause birth defects.
- 22) The habituation technique operates on the premise that _____.
 - A. infants can discriminate different shapes
 - B. infants' heart rates increase when they are placed on a visual cliff
 - C. infants look longer at an event that fulfills their expectation
 - D. infants look longer at something novel
- 23) What is NOT true about the theory of cognitive development proposed by Piaget?
 - A. Infants are born with rich, conceptual schemas that guide their behaviors and reasoning behind them.
 - B. The process of assimilation allows the infant to use existing schemas to take in new stimuli and respond accordingly.
 - C. The process of accommodation results in schemas' changing as necessary to cope with a broader range of situations.
 - D. Each stage of development is governed by a different type of logic, that is, a system of rules that guides the child's thought.
- 24) In contrast to Piaget, Vygotsky's sociocultural theory emphasized:
 - A. The importance of experience in constructing representations of the world
 - B. The role of adults to promote cognitive development by explicitly instructing children
 - C. The importance of motor skills that enable children to explore the social environment
 - D. How the culture affects cognitive development independent of how the brain affects cognitive development.

Name:	TA:	

- 25) Choose the INCORRECT description about Kohlberg's theory of moral development.
 - A. Kohlberg's approach was an extension of Piaget's method to study moral development.
 - B. Kohlberg's primary interest was in participants' conclusions about what the character should do in moral dilemmas, rather than their explanations for the conclusions.
 - C. In Kohlberg's theory, someone who focuses on reward and punishment can be said to be in the preconventional level.
 - D. In Kohlberg's theory, someone who focuses on abstract moral principles can be said to be in the postconventional level.
- 26) Choose the INCORRECT description about social and emotional development during adulthood.
 - A. Erikson proposed three stages of adult psychosocial development, 'young adulthood', 'middle adulthood', and 'old age'.
 - B. Erikson's stages are characterized by major challenges a person is most likely to confront and need to resolve.
 - C. Personality remains relatively stable over the years, and even when a person feels that his/her personality has changed it actually hasn't.
 - D. With age, people become better able to regulate emotions because their emotions are blunted or diminished.
- 27) Glucocorticoids (a class of hormones released during the stress response) have which effect?
 - A. They increase heart rate and blood pressure.
 - B. They decrease the body's immune response (anti-inflammatory).
 - C. They boost the body's immune response (pro-inflammatory).
 - D. They direct energy towards digestive and reproductive systems.
- 28) The personality trait that is associated with increased stress response (including higher blood pressure and more negative mood) and a greater likelihood of dying from heart disease is
 - A. Introversion
 - B. Ambition
 - C. Cynicism
 - D. Hostility

Name:	TA:	

29) Which of these is TRUE of social support?

- A. Social support affects the emotional response to stress but has no effect on health or longevity.
- B. Perceived social support is more important than the actual size of one's social network.
- C. Enacted social support (such as bringing dinner to a friend who is busy studying for exams) is most important in decreasing stress.
- D. Enacted social support always decreases stress, even if the support comes from a person with whom you have a negative relationship.
- 30) Which is the best description of people who respond to stress with aggression?
 - A. They have an overinflated self-image.
 - B. They are very good at correctly discerning the intentions of others.
 - C. They tend to experience fewer stressors than people who do not respond aggressively.
 - D. They have low self-esteem.
- 31) Which of the following is FALSE concerning optimism?
 - A. Optimists are less likely than pessimists to die of heart problems.
 - B. Optimists do not have better coping skills than pessimists.
 - C. Optimists report feeling less stress than pessimists.
 - D. Optimists have better moods during times of stress than pessimists.
- 32) Which of these is an example of an acute stressor?
 - A. Feeling socially isolated
 - B. Having a heavy academic workload
 - C. Working on a big paper due tomorrow
 - D. Having cancer
- 33)Bertram is stressed out about a big job interview next week. Which of these is a problem-focused coping strategy he could use to deal with his stress?
 - A. Write about his feelings in a journal
 - B. Do something to take his mind off the interview
 - C. Get interview tips from the career counselor
 - D. Try to see the interview as a positive experience and not something to be afraid of

Name:	TA:	

- 48)In an "implicit association task", participants are shown photographs of White or Black individuals, followed by photographs of either guns or tools. Participants are instructed to press a button to indicate whether the second photograph was a gun or a tool. For non-Black participants, the most common results of this experiment are:
 - A. Participants respond more quickly to the tool when the face was Black
 - B. Participants respond more quickly to the gun when the face was White
 - C. Participants respond more quickly to the gun when the face was Black
 - D. Participants always responded more quickly to the guns than the tools.
- 49)In an experiment, unacquainted male and female participants have a brief phone conversation. Before the conversation, the male is shown a photograph of either a very attractive woman or an unattractive woman, and told that he will be conversing with the woman in the photograph. Later, a naive listener will hear a recording of only the woman's side of the conversation and indicate whether he thinks the woman is warm and likeable. Listeners tend to judge the woman as "more warm and likeable" when the first man received an attractive picture. This effects is known as a/an _______.
 - A. Foot in the door
 - B. Self-fulfilling prophecy
 - C. External attribution
 - D. Attributional bias
- 50)People generally tend to speak their own mind, but in situations where most of their compatriots are of a different opinion, people will frequently yield to the majority opinion, even if it is obviously wrong. This phenomenon is known as:
 - A. Compliance
 - B. the Bystander effect
 - C. Social Loafing
 - D. Conformity
