18.085 Quiz 2 November 3, 2006 Professor Strang

## Your PRINTED name is: <br> Grading 1

1) ( $\mathbf{2 5}$ pts.) This network (square grid) has 12 edges and 9 nodes.

(a) Do not write the incidence matrix! Do not give me a MATLAB code! Just tell me:
(1) How many independent columns in $A$ ?
(2) How many independent solutions to $A^{\mathrm{T}} y=0$ ?
(3) What is row 5 (coming from node 5) of $A^{\mathrm{T}} A$ ?

I do want the whole of row 5 .
(b) Suppose the node 2 has voltage $u_{2}=1$, and node 8 has voltage $u_{8}=0$ (ground). All edges have the same conductance $c$. On the second picture write all of the other voltages $u_{1}$ to $u_{9}$. Check equation 5 of $A^{\mathrm{T}} A u=0$ (at the middle node).
2) ( $\mathbf{2 5}$ pts.) Suppose that square grid becomes a plane truss (usual pin joints at the 9 nodes). Nodes 2 and 8 now have supports so $u_{2}^{\mathrm{H}}=u_{2}^{\mathrm{V}}=u_{8}^{\mathrm{H}}=u_{8}^{\mathrm{V}}=0$.

(a) Think about the strain-displacement matrix $A$. Are there any mechanisms that solve $A u=0$ ? If there are, tell me carefully how many and draw a complete set.
(b) Suppose now that all 8 of the outside nodes are fixed. Only node 5 is free to move. There are forces $f_{5}^{\mathrm{H}}$ and $f_{5}^{\mathrm{V}}$ on that node. The bars connected to it (North East South West) have constants $c_{N} c_{E} c_{S} c_{W}$. What is the (reduced) matrix $A$ for this truss on the right? What is the reduced matrix $A^{\mathrm{T}} C A$ ? What are the displacements $u_{5}^{\mathrm{H}}$ and $u_{5}^{\mathrm{V}}$ ? For 1 point, is that truss (fixed at 8 nodes) statically determinate or indeterminate?
3) (25 pts.) This question is about the velocity field $v(x, y)=(0, x)=w(x, y)$.
(a) Check that $\operatorname{div} w=0$ and find a stream function $s(x, y)$. Draw the streamlines in the $x y$ plane and show some velocity vectors.
(b) Is this shear flow a gradient field $(v=\operatorname{grad} u)$ or is there rotation? If you believe $u$ exists, find it. If you believe there is rotation, explain how this is possible with the streamlines you drew in part (a).
4) ( 25 pts.) Suppose I use linear finite elements (hat functions $\phi(x)=$ trial functions $V(x)$ ). The equation has $c(x)=1+x$ and a point load:

$$
\text { Fixed-free } \quad-\frac{d}{d x}\left((1+x) \frac{d u}{d x}\right)=\delta\left(x-\frac{1}{2}\right) \quad \begin{aligned}
& \text { with } \quad u(0)=0 \\
& \text { and } u^{\prime}(1)=0 .
\end{aligned}
$$

Take $h=1 / 3$ with two hats and a half-hat as in the notes.
(a) On the middle interval from $1 / 3$ to $2 / 3, U(x)$ goes linearly from $U_{1}$ to $U_{2}$. Compute

$$
\int_{1 / 3}^{2 / 3} c(x)\left(U^{\prime}(x)\right)^{2} d x \quad \text { and } \quad \int_{1 / 3}^{2 / 3} \delta\left(x-\frac{1}{2}\right) U(x) d x
$$

Write those answers as

$$
\left[\begin{array}{ll}
U_{1} & U_{2}
\end{array}\right]\left[\begin{array}{ll}
? & ? \\
? & ?
\end{array}\right]\left[\begin{array}{l}
U_{1} \\
U_{2}
\end{array}\right] \quad \text { and } \quad\left[\begin{array}{ll}
U_{1} & U_{2}
\end{array}\right]\left[\begin{array}{l}
? \\
?
\end{array}\right]
$$

You have found the 2 by 2 "element stiffness matrix" and the 2 by 1 "element load vector."
(b) On the first and third intervals, similar integrations give

$$
\begin{gathered}
{\left[U_{1}\right][? ?]\left[U_{1}\right]}
\end{gathered} \text { and }\left[U_{1}\right][0] ; ~\left[\begin{array}{rr}
5.5 & -5.5 \\
-5.5 & 5.5
\end{array}\right]\left[\begin{array}{l}
U_{2} \\
U_{2}
\end{array}\right] \quad \text { and }\left[\begin{array}{ll}
U_{2} & U_{3}
\end{array}\right]\left[\begin{array}{l}
0 \\
0
\end{array}\right] .
$$

Assuming your calculations and mine are correct, what would be the overall finite element equation $K U=F$ ? (Not to solve)
xxxx
