# Massachusetts Institute of Technology <br> DEPARTMENT OF MECHANICAL ENGINEERING <br> Center of Ocean Engineering 

### 2.611 SHIP POWER and PROPULSION Fall 2006, Quiz 1 - Solutions

1) $(20 \mathrm{pts})$
a) Discuss how Controllable Reversible Pitch (CRP) propellers can help prevent engine overloading. Consider your answer in terms of Torque (Q), angle of attack ( $\alpha$ ), Lift, Drag, Velocity of Advance (J), Pitch, and shaft speed. (The use of all terms is not necessary as long as a logical sound argument is made.) (10pts)

A number of factors such as heavy seas, towing evolutions, and / or excessive loading conditions may cause J to decrease. Generally, with CRP propellers operating above 12 knots, the speed of the shaft is programmed to remain constant. To compensate for the decrease in relative water velocity the angle of attack should increase. This will result in an increase in lift and thus require additional torque from the main engines. To bring the engine torque back to its original designed value the pitch is reduced by controlling the angle of attack. This allows the engine to operate at designed torque and prevent overloading
b) Discuss the cause of $u_{a}$ and $u_{t}$.

The vortex produced by the propeller action affects the flow field over the propeller. These effect velocity in the direction of advance and transverse directions and are represented by $u_{a}$ and $u_{t}$. This changes the angle of inflow and produces $\mathrm{V}^{*}$ (10 pts)

2) (50 pts) A ship captain must purchase a new propeller to replace the damaged one currently installed on his ship. The supplier only has two propellers in stock. Both are fixed pitch, 5 blade Wageningen B-series propeller with an EAR of .45 , one has a pitch of 17.1 ft and the other a pitch of 20.9 ft . The details of the ship are as follows:

Conversion factors
Ship and Propeller characteristics:
B-series 5-45 propeller (see attached sheet)
Pitch $_{1}=17.1 \mathrm{ft}$ or $\mathrm{Pitch}_{2}=20.9 \mathrm{ft}$
knot $=1.688 \frac{\mathrm{ft}}{\mathrm{sec}}$
Diameter $=19 \mathrm{ft}$
Wake Reduction Factor, $\mathrm{w}=.2$
Thrust Reduction Factor, $\mathrm{t}=.12$
Relative Rotative Efficiency, $\eta_{\mathrm{R}}=0.89$
Ship Resistance at max Power, 174800 lbf
Velocity of the ship $=20$ kts
a) Using the provided Wageningen B-Series design curves, determine the best choice between the two propellers in stock with respect to efficiency $\eta_{\mathrm{o}}$. ( $\mathrm{J}^{2}$ function, $\eta_{\mathrm{o}}$, and correct choice -20 pts )
b) Determine $\mathrm{J}_{\text {optimum }}, \mathrm{K}_{\text {Toptimum }}, \mathrm{K}_{\text {Qoptimum }}(15 \mathrm{pts})$
c) Determine the Optimal propeller speed $\mathrm{n}_{\mathrm{p}}$. ( 5 pts )
d) Calculate Thrust (T) and Torque (Q) (5pts)
e) The ship's engines are capable or producing $16 \times 10^{3} \mathrm{HP}$, will the ships engines be adequate for propeller selected? (5pts)

## Solution

> only thing unknown is n, eliminate ...

$$
\mathrm{Kt}=\frac{\mathrm{T}}{\rho \cdot \mathrm{n}^{2} \cdot \mathrm{D}^{4}} \quad \mathrm{~J}=\frac{\mathrm{V}_{\mathrm{A}}}{\mathrm{n} \cdot \mathrm{D}} \quad \frac{\mathrm{~K}_{\mathrm{t}}}{\mathrm{~J}^{2}}=\frac{\mathrm{T}}{\rho \cdot \mathrm{n}^{2} \cdot D^{4}} \cdot \frac{\mathrm{n}^{2} \cdot \mathrm{D}^{2}}{\mathrm{~V}_{A}^{2}}=\frac{\mathrm{T}}{\rho \cdot D^{2} \cdot V_{A}^{2}}
$$

$\mathrm{Kt} / \mathrm{J}^{2}$ is constant; independent of $n$ and P/D, Determine $n$, P/D which gives maximum $\eta_{0}$.
$\mathrm{V}_{\mathrm{S}}:=20 \mathrm{knot} \quad \mathrm{w}:=0.2 \quad \mathrm{t}:=0.12 \quad \mathrm{D}:=19 \cdot \mathrm{ft} \quad \mathrm{R}:=174800 \mathrm{lbf}$
$\mathrm{V}_{\mathrm{A}}:=(1-\mathrm{w}) \cdot \mathrm{V}_{\mathrm{S}} \quad \mathrm{V}_{\mathrm{A}}=16 \mathrm{knot} \quad \mathrm{T}_{\mathrm{W}}:=\frac{\mathrm{R}}{1-\mathrm{t}} \quad \mathrm{T}=1.986 \times 10^{5} \mathrm{lbf}$

Kt_over_J_sq $:=\frac{\mathrm{T}}{\rho \cdot \mathrm{D}^{2} \cdot \mathrm{~V}_{\mathrm{A}}{ }^{2}} \quad \sqrt{\text { Kt_over_J_sq }=0.379}$
a) Draw $\mathrm{K}_{\mathrm{T}}=.379 * \mathrm{~J}^{2}$ function on $\mathrm{B} 5-45$ Chart to determine the most efficient design

| b) From the B 5-45 | For P/D of .9 |  |
| :--- | :--- | :--- |
| Charts | J_1= 655 |  |
|  | For P/D of 1.1 |  |
| $\mathrm{~K}_{\mathrm{T}}=.14$ | $\mathrm{~J}_{2}=.755$ |  |
|  | $\mathrm{~K}_{\mathrm{Q}}=.027$ | $\mathrm{~K}_{\mathrm{T}}=.22$ |
|  | $\eta \mathrm{O}=.63$ | $\mathrm{~K}_{\mathrm{Q}}=.04$ |
|  |  | $\eta \mathrm{O}=.65$ |

Using the above $J$ and $P / D=1.1$ on the $B 5-45$ plot, we get $K_{T}:=0.22$ and $K_{Q}:=\frac{0.4}{10}$
c)

$$
\mathrm{n}_{\mathrm{p}}:=\frac{\mathrm{V}_{\mathrm{A}}}{\mathrm{~J} \_2 \cdot \mathrm{D}} \quad \mathrm{n}_{\mathrm{p}}=112.952 \frac{1}{\min }
$$

$$
\begin{array}{ll}
T_{N}:=K_{T} \cdot \rho \cdot n_{p}^{2} \cdot D^{4} & \begin{array}{|l}
T=2.022 \times 10^{5} \mathrm{lbf} \\
Q:=K_{Q} \cdot \rho \cdot n_{p}^{2} \cdot D^{5}
\end{array} \\
Q=6.987 \times 10^{5} \mathrm{lbf} \cdot \mathrm{ft}
\end{array}
$$

d) Power delivered by the engines is not quite enough to support the optimum propeller.
$\eta_{0}:=.65 \quad \mathrm{P}_{\mathrm{E}}:=\frac{\mathrm{R} \cdot \mathrm{V}_{\mathrm{s}}}{550 \cdot \frac{\mathrm{lbf} \cdot \mathrm{ft}}{\mathrm{s} \cdot \mathrm{hp}}} \quad \eta_{\mathrm{R}}:=.8 \mathrm{~s}$

$$
\mathrm{P}_{\mathrm{E}}=1.073 \times 10^{4} \mathrm{hp}
$$

$\eta_{H}:=\frac{1-t}{1-w}$

$$
\mathrm{QPC}:=\eta_{0} \cdot \eta_{\mathrm{H}} \cdot \eta_{\mathrm{R}} \quad \mathrm{P}_{\mathrm{D}}:=\frac{\mathrm{P}_{\mathrm{E}}}{\mathrm{QPC}}
$$

$$
\mathrm{QPC}=0.636
$$

Power delivered by the engines is not quite enough to

$$
\mathrm{P}_{\mathrm{D}}=1.686 \times 10^{4} \mathrm{hp}
$$ support the optimum propeller.

Looking at exercise 1 in chapter 10 , the required propeller power $P_{D}$ is what was being asked for. $P_{E}$ in this case required looking at the resistance due to hull form. That is the reason it is calculated this way. Only 2-4 pts taken for incorrect answers.
2) (30 pts) The same Captain asks you to design a new propeller for his pleasure boat. You run PVL and get the following results at $\mathrm{r} / \mathrm{R}=.7$ :

Given:
$\mathrm{r} / \mathrm{R}=.7$
Nprop $=220$ rpm
D $=1 \mathrm{~m}$
$\mathrm{Va}=18 \mathrm{~m} / \mathrm{s}$
$\mathrm{Vt}=0 \mathrm{~m} / \mathrm{s}$
$U \mathrm{Ut}^{*}=-.9 \mathrm{~m} / \mathrm{s}$
$\mathrm{Ua}^{*}=.9 \mathrm{~m} / \mathrm{s}$
$\mathrm{G}=.7 \mathrm{~m}^{\wedge} 2 / \mathrm{s}$
$\mathrm{c}=.18 \mathrm{~m}$
$\mathrm{w}=0$
a) Draw the inflow vector diagram at .7 R (10 pts)
b) Find $\mathrm{V}^{*}(10 \mathrm{pts})$
i) Hint: $\omega=2 * \mathrm{pi}^{*} \mathrm{~N}$
c) What is $\mathrm{C}_{\mathrm{L}}$ ? $(5 \mathrm{pts})$
d) How do we determine if the blade will cavitate? No calculations are required. You can describe or use formulas. You do not have enough information to calculate a number for this blade. (5pts)
3) Lifting Line theory Question
a) Flow Vector Diagram

$$
\underset{\sim}{w}:=0 \quad c_{M}^{c}:=.18 \cdot m
$$

b) Find $V^{*}$

$$
\mathrm{D}:=1 \cdot \mathrm{~m} \quad \mathrm{~V}_{\mathrm{a}}:=18 \cdot \frac{\mathrm{~m}}{\mathrm{~s}} \quad \mathrm{~N}_{\text {prop }}:=220 \cdot \min ^{-1}
$$

$$
\Gamma_{w}:=.7 \cdot \frac{\mathrm{~m}^{2}}{\mathrm{~s}} \quad \boxed{\mathrm{G}}:=\Gamma
$$

$$
\text { utstar }:=-.9 \cdot \frac{\mathrm{~m}}{\mathrm{~s}} \quad \text { uastar }:=.9 \frac{\mathrm{~m}}{\mathrm{~s}} \quad \underset{\mathrm{~m}}{\mathrm{R}}:=\frac{\mathrm{D}}{2} \quad \frac{\mathrm{r}}{\mathrm{R}}=.7 \quad \mathrm{r}:=.7 \cdot \mathrm{R} \quad \mathrm{r}=0.35 \mathrm{~m}
$$

$\omega:=2 \cdot \pi \cdot \mathrm{~N}_{\text {prop }}$
$\omega=23.038 \frac{1}{\mathrm{~s}}$
$\omega \mathrm{r}:=\omega \cdot \mathrm{r}$

$$
\omega r=8.063 \frac{\mathrm{~m}}{\mathrm{~s}}
$$

Vstar := $\left.=\sqrt{(\omega \mathrm{m}+\mathrm{utstar})^{2}+\left(\mathrm{V}_{\mathrm{a}}+\mathrm{uastar}\right)^{2}}\right] \quad \begin{aligned} & \text { Note: The Vs cancels out of the eqn so able to use }\end{aligned}$ PVL values

$$
\text { Vstar }=20.212 \frac{\mathrm{~m}}{\mathrm{~s}}
$$

c) find CL

Now we know that

$$
\mathrm{L}=\rho \cdot \mathrm{V} \operatorname{star} \cdot \Gamma=\frac{1}{2} \cdot \rho \cdot \mathrm{Vstar}^{2} \cdot \mathrm{c} \cdot \mathrm{C}_{\mathrm{L}}
$$

therefore:

$$
\mathrm{C}_{\mathrm{L}}:=\frac{\Gamma \cdot 2}{\mathrm{Vstar} \cdot \mathrm{c}}
$$

$$
C_{L}=0.385
$$

d) How to determine if a blade will cavitate

If-Cpmin is greater than $\sigma_{\text {local }}$ then the blade will cavitate.

$$
P_{i n f}=P_{\mathrm{atm}}+\rho \cdot \mathrm{g} \cdot \mathrm{~h}
$$

$$
\sigma_{\text {local }}:=\frac{\mathrm{P}_{\text {inf }}-\mathrm{P}_{\mathrm{vap}}}{\frac{1}{2} \cdot \rho \cdot \mathrm{~V}_{\mathrm{star}}^{2}}
$$

The lowest $\mathrm{P}_{\text {inf }}$ occurs at the shallowest blade depth of the blade section
