Problem Set II
Due 09/26/06

1. Consider a cylindrical vessel of inner radius $R$ and wall thickness $t$ with flat ends. The pressure inside the vessel is $P_{i}$ and the surrounding pressure $P_{o}$. What is the relative error in estimating the maximum value of the stress intensity in the cylinder based on the thin shell approximation for values of:

$$
\begin{aligned}
t / R & =0.03 \\
t / R & =0.10 \\
t / R & =0.15 \\
t / R & =0.30
\end{aligned}
$$

Consider two cases:

$$
\begin{gathered}
P_{i}=2 P_{o} \\
P_{i}=20 P_{o}
\end{gathered}
$$

2. A pressure vessel is constructed of a cylinder with a hemispherical head at each end. There is no external restraint to either axial or radial displacement. Inside radius of both cylinder and hemispheres is $R$. The wall thickness is uniform at a value $t$. The length of the cylinder is $L$. No flaws or stress concentrations are present. Dimensions are:

$$
\begin{aligned}
R & =110 \mathrm{~cm} \\
t & =11 \mathrm{~cm} \\
L & =433 \mathrm{~cm}
\end{aligned}
$$

Material properties:

$$
\begin{gathered}
\text { Young's modulus }=200 \mathrm{GPa} \\
\text { Poisson's ratio }=0.3 \\
\text { Coefficient of thermal expansion }=12 \mu \mathrm{~m} / \mathrm{mK}
\end{gathered}
$$

The vessel is pressurized to a design pressure $\mathrm{P}=15.5 \mathrm{MPa}$.
Questions:
(a) What is the total (peak) stress as a function of radial position $(z)$ at a junction between cylinder and hemisphere.
(b) What is the maximum radial displacement of the vessel cylinder and sphere?
